

This code allows your files to be played in all browsers across platforms.

```
<p><audio width="729" height="33" controls="controls" autoplay="autoplay">
```

```
<source src="YourFilesHere.edu" type="audio/mp3" />
```

```
<source src="YourFilesHere.edu" type="audio/ogg" /></audio></p>
```

After src= you will notice "", with a sample web address to the audio files. You will replace this with the full web address for the mp3 and ogg files. To get their full web addresses, click on each file from the content collection and copy the address at the top of the address bar. Once you have the web address, replace the "YourFilesHere.edu" with the correct address.

NOTE: Do not change the order of the code. The mp3 file must be listed first in order to work.

If you need to convert your mp3 file to an ogg file Audacity is a free file converter you can download from <http://sourceforge.net/projects/audacity/>.
